

SYSTEMPREP 1.1

“Install complete infrastructures in a minimum amount of time”

Pricing:

Personal Edition: US\$ 99,-
(up to 20 users)

Standard Edition: US\$ 449,-
(up to 100 users)

Enterprise Edition: US\$ 1.999,-
(unlimited users)

Requirements:

Hardware:

- IBM compatible PC
- min.166 MHz CPU (intel / AMD)
- min. 64 MB RAM

Software:

- Microsoft Windows-NT 4.0 or Windows-200x domain
- Microsoft or 3rd party DHCP server

SystemPrep is a product for the automated, rapid and safe deployment of operating systems, additional software and drivers onto remote computers. It supports single site as well as multiple site WAN scenarios, with minimal configuration effort.

SystemPrep complies to the Intel Wired for Management (WfM), Preboot Execution Environment (PXE) 2.x specifications.

To bootstrap clients into the installation process it supports:

- PXE & TCP/IP Boot ROMs
- PXE & TCP/IP Boot ROM code located on a 3,5" disk.
- conventional DOS based installations disks

To automatically power on a previously shutdown computer, before the installation takes place, it optionally supports Wake On LAN technology

How does it work ?

SystemPrep discovers any new clients. Next the administrator configures the desired operating system and installation parameters. Finally SystemPrep executes all necessary steps, beginning with the partitioning and formatting of the local hard disks, the installation of the selected operating system and any 3rd party hardware drivers.

Installation of additional software, for example service packs, applications, updates, etc. can be integrated into the unattended setup process easily. The configured software will be installed automatically following the installation of the operating system.

Furthermore SystemPrep lets you add additional or updated hardware-drivers, to be used during the installation process of new or existing computers.

SystemPrep's optional browser based service allows the administrator to use mobiles or other small devices to monitor the installation status and to initiate the installation of clients over the intranet or internet.

Configuring SystemPrep

The entire configuration of SystemPrep is completely graphical. It includes a unique wizard that guides the administrator through processes like:

- the initial configuration of SystemPrep
- the creation of conventional DOS based installation disks
- the creation of PXE & TCP/IP remote boot images
- adding new installable operating system images
- adding 3rd party hardware drivers to be incorporated into the client installation
- definition of a site hierarchy, in case of multiple site WAN environments
